School of Computing and Information Systems COMP30026 Models of Computation Problem Set 11

11 – 15 October 2021

Content: Turing machines, decidability, recognisability, closure results

- P11.1 Show that the class of decidable languages is closed under complement. Why can't we use the same argument to show that the class of Turing recognisable languages is closed under complement?
- P11.2 Show that the class of decidable languages is closed under concatenation, as well as under Kleene star.
- P11.3 A 2-PDA is a pushdown automaton that has two stacks instead of one. In each transition step it may consume an input symbol, pop and/or push to stack 1, and pop an/or push to stack 2. It can also leave out any of these options (using ϵ moves) just like the standard PDA. In the Week 9 lecture we used the pumping lemma for context-free languages to established that the language $B = \{0^n 1^n 2^n \mid n \in \mathbb{N}\}$ is not context-free. However, B has a 2-PDA that recognizes it. Outline in English or Pseudo-code how that 2-PDA option P11.4 In fact, a 2-PDA is as powerful as a Turing machine. Outline an argument for this proposition
- P11.4 In fact, a 2-PDA is as powerful as a Turing machine. Outline an argument for this proposition by showing how a 2
 at any point during si machine's tape, at the true of the Turing machine's tape, at the true of the t
- P11.5 For each of the following languages, write an algorith

 Turing machine that decides the following languages Assu

 Add Wethat edu assist_pro
 - (i) $\{w \mid w \text{ has an equal number of 0's and 1's}\}$
 - (ii) $\{w \mid w \text{ has twice as many 0's as 1's}\}$
 - (iii) $\{w \mid w \text{ does not have twice as many 0's as 1's}\}$
- P11.6 For each language in the previous question, draw a Turing machine that carries out the pseudocode. Then write down the sequence of configurations your TM goes through on an interesting input.
- P11.7 Show that the problem of whether the language of a DFA is empty, is decidable. That is, show that the language

$$E_{DFA} = \{\langle D \rangle \mid D \text{ is a DFA and } L(D) = \emptyset\}$$

is decidable. Hint: Write pseudocode for an algorithm which analyses the graph of the DFA, and argue that your algorithm will not run forever on any input DFA $\langle D \rangle$.

P11.8 Show that the problem of whether the language of a CFG is empty, is decidable. That is, show that the language

$$E_{CFG} = \{ \langle G \rangle \mid G \text{ is a CFG and } L(G) = \emptyset \}$$

is decidable. Hint: Write pseudocode for an algorithm which analyses the rules of the CFG, and argue that your algorithm will not run forever on any input CFG $\langle G \rangle$.
